

Suzuki's traction control system continuously monitors the front and rear wheel speeds, the throttle position sensor, the crank position sensor, and the gear position sensor. It quickly reduces engine output when it detects wheel spin. It controls the engine output by managing the ignition timing and air delivery every 4 milliseconds.

The rider can select three modes (1, 2, and off). Modes 1 and 2 differ in terms of sensitivity. Mode 1 has lower sensitivity; it allows a certain degree of rear wheel spin. Mode 2 has higher sensitivity; the system effects traction

control sooner. *NOTE: The traction control system is not a substitute* for the rider's throttle control. It cannot prevent loss of traction due to excessive speed when the rider enters a turn and/or applies the brakes.

A redesigned 1037cc, 90-degree V-twin engine is designed to get you where you want to go. Whether it is around town, on the open highway, or down the road less traveled.

The light and compact Anti-Lock brake system (ABS)* system
